I am not asking HHS to consider my individual experience as scientific proof of causation. I am asking that experiences such as mine be taken seriously as health observations and considered alongside the scientific evidence when identifying research gaps and determining whether additional investigation is warranted.

I believe particular attention should be given to long-term and cumulative exposure, individual susceptibility, real-world exposure conditions, and people who report significant symptoms in connection with wireless and utility-meter environments. I also believe that people who report these experiences should have appropriate medical and public-health resources available to them rather than having their experiences dismissed simply because the science is not yet settled.

I have photographs, videos, medical records, and other documentation relating to my experience and the environment around my home. I am willing to provide supporting documentation if requested.

I am sharing my experience because I do not want other people—particularly children, older adults, people with existing health conditions, or others who may be especially sensitive to environmental exposures—to find themselves struggling in their own homes without their experiences being heard and properly investigated.

I respectfully ask HHS to continue investigating reported health effects associated with RF/EMF exposure, including non-cancer effects, long-term and cumulative exposure, individual susceptibility, and real-world exposure conditions, and to ensure that appropriate medical, biological, and public-health expertise is included in that work.
