DTI Modeling of Beta-1 Connectivity Results

Beta-1 (12-15 Hz). In the axial model above, the DTI fiber tracts (right) are based on the connectivity results. Indicated here are the midbody of the corpus callosum suggesting substantially reduced interhemispheric processing of sensorimotor function.

Left	Front
	
Left side shows the (1) midbody of the corpus collosum and (2) right cingulum.	Frontal orientation shows the (1) midbody corpus collosum fibers and (2) left corticostriatal pathway.
