A Report on Non-Ionizing Radiation

Dutch Annual Report

February 15, 2007

The Health Council of the Netherlands issued its fourth Annual Update [2006] on EMFs today, concluding that there is no evidence of RF radiation health risks from the country's UMTS (3G) mobile phone network or from DECT base stations. The council also advises that last year's Swiss study — which failed to confirm an earlier Dutch study showing a decrease in "well-being" due to EMF exposure— had an "improved design" and should therefore be given "more weight." The council's 2006 report is in Dutch and in English; the English text begins on p.53. See also its press release.

Health Council of the Netherlands,
