R.I.P. A.C.R.B.R.

June 10, 2011

Today, the Australian Centre for Radiofrequency Bioeffects Research (ACRBR) is closing its doors. The center has gone bust for the most commonplace reason: It ran out of cash.

To understand why no one wanted to give the ACRBR any more money —we concede that there hasn't been much around— you need only read the last couple of paragraphs of the last post by its outgoing executive director, Rodney Croft:

> "[S]cience has not been able to identify any harmful effects resulting from RF in study participants, regardless of age. This is why expert committees are unanimous in their view that low-level RF is safe. Science, of course, can never be 100% certain of its conclusions, but a lot is now known. The result? We can be very confident that low-level RF is safe."

End of story.

ACRBR, Rodney Croft,
