My experience with electromagnetic (wireless) radiation.

About 12 years ago I developed a sensitivity to wireless radiation – most apparently with wifi and cell tower radiation. The consequence of this is as follows.

I experience symptoms after less than an hour exposure including the following

- Headaches
- Nausea
- Dizziness
- Disorientation – I have had difficulty finding my way home after exposure.
- Physical weakness and shaking
- Unable to think or express myself clearly.
- Fatigue and exhaustion
- Insomnia

I am unable to participate in normal life. I cannot go to cafes, restaurants, shopping centres, local beaches, cinemas, any urban area or town centre, medical facilities or hospitals. I am unable to use any form of public transport as they all have wifi. As a result my social life is more or less non-existant. I am unable to travel or participate in any voluntary activities. Everywhere I should be able to go for any of these activities is infested with wireless radiation which leaves me feeling ill for hours or days after exposure, and seriously impairs my ability to function physically and mentally.

I have received no help from the medical profession. Any doctor have spoken to about this has treated me with ridicule, contempt or dismissal. The level of ignorance and denial is breathtaking. Healthcare professionals must be properly trained in this area, and healthcare facilities must have wifi and cell towers removed. As an example, there is research connecting wireless radiation with antibiotic resistance but every facility I'm aware of has wifi regardless.

This is not just my experience. Clearly the existing standards do not provide adequate protection. They need to be updated and made much stricter to protect people like me and particulary children, who are obviousy more susceptible to the kinds of insults.

Decisive action is needed. The regulatory bodies need to stand up to the wireless industry and to public facilities (like healthcare) who install wifi with no consideration of the consequences. Standards need to be set to protect the public.

Public education is also needed. Most people are totally ignorant of the various harms which can arise from this technology, and particularly the impact on children.
