I implore the FCC to consider that 5G is an untested range of frequencies, and that there are no safety or public health studies on short-term or long-term exposure to this millimeter wave wireless radiation. There are millions of Americans like me, who could work and have normal lives, if it weren't for ubiquitous chronic exposure to things like cell phone towers, AMI smart meters, high transmission power lines, electric and automated vehicles, wireless-emitting black boxes in vehicles, LED street lamps, car headlights, computer and television backlights, and/or 5G ground infrastructure and its associated satellite infrastructure. It's time for the FCC to develop much more stringent safety standards for both short-term and long-term human exposure to man-made radiofrequency (RF) wireless radiation, in all its forms. The electromagnetically hypersensitive (EHS) community represents an enormous cost to the American economy, and most of us with EHS, myself included, are depressed about being unable to work or participate in everyday life and society. The power companies, telecom industry, and its contractors, are committing unlawful trespass when they install AMI smart meters and/or 5G infrastructure on our residences and/or residential and/or commercial properties. The aforementioned groups have absolutely no easement (rightful access) to do anything on a property where a person rents or that a person owns. They are also violating my rights under the Americans with Disabilities Act (ADA) when they install any wireless RF-emitting tech within signal range of my person. 5G ground infrastructure would also decrease property values, as well as violate American privacy laws and certain international human rights laws. Please read the other included documents, and educate yourselves on how enormous a public health threat man-made wireless RF radiation is. Thank you for considering the most vulnerable among us, and God bless you. -Elysia Drew
