The moment an AMI Landis + Gyr Smart Meter was installed on our home in 2014 we started having health problems and experiencing heart palpitations, ringing in the ears, sensitive teeth, increased blood pressure, and sleepless nights.

We had no wireless devices in our home but we were forced to have a wireless meter and live with the results. We felt like a prisoners in our own home. We made my case to the electric company and the Public Utility with the help of a lawyer. When it became cost prohibitive to continue our pursuit to get the wireless meter off of our house we went off the grid with a full solar system We are 66 and 67 years old and instead of putting money towards retirement we were forced to seek an alternative power source for the sake of our health. The solar system cost us over $130,000!

Our house is totally hard wired with no wireless whatsoever. We are slowly recovering from this assault on our health. But now we are worried about the being bombarded with a blanket of more wireless radiation with high pulsating frequencies. We feel like canaries in a coal mine! How has this technology been determined to be safe with no health effects to prevent? There is a need for safety testing to determine safe levels of exposure rather than reliance of false assumptions and unproven theoretical models.

The FCC is unqualified to determine exposure levels because it lacks a health and safety dept and staff with degrees and specialized training in biological sciences. The FCC lacks expertise and safety testing to make this determination.

The FCC industry seems have been captured and is unbiased as it adopts new rules on higher frequency microwave exposures above 6GHz. This is a gross violation of our health and safety and in particular violates the Americans with Disabilities Act.
