The FCC's repeated refusal to consider biological effects from exposure to all types of wireless radiation shows a clear and dangerous intention to disregard the emerging science which must inform its decisions regarding public health.

The agency's reliance on organizations of physicists and engineers for advice on human exposures has resulted in a sole focus on "thermal" effects, despite thousands of published, peer-reviewed studies showing biological harm, even at non-thermal levels, for various frequency ranges.

The FCC's own admission that it is unaware of any other types of effects demonstrates a failure to actively investigate the issue by proactively engaging with the scientific community studying the short and long-term biological impacts of exposure to humans and possible interference with systems of the natural world. Failure to seek out and consider the latest science makes decisions of the FCC suspect.

Moreover, the complex comment process used by the FCC virtually ensures that most commenters will be those who follow the activities of the agency closely and have a financial interest in the agency's decisions.

I was severely injured by an airport body scanner while on a business trip several years ago, and was sick for over a year, and still have sensitivity to microwave radiation which limits my daily life to this day. The injuries include DNA damage and adhesions all over my body, especially head and the lower abdominal area. I spent over a year and much money working with a number of doctors and specialists between Virginia and New York, to heal the damage and restore my health. I could not go out much in public spaces as any acute exposure to microwaves, mobile phones, WiFi, EMFs and other fields would cause me to get severely ill – with symptoms including nausea, muscle pain, headache, inability to eat or drink anything, blurred vision, loss of smell and taste, ringing in the ears, insomnia, etc.

If it is your job to protect us, why are you not doing it?
