CONFIDENTIAL

State: Colorado

Name: Jill Iwaskow

Wireless Health Effects: I have severe reactions to chemicals (including synthetic fragrances), and EMF. From EMF specifically, I get arrhythmia that even shows up on a heart monitor, severely swollen fingers, anxiety, headaches, brain fog, nightmares or inability to sleep. I was part of a study in Boulder years ago that showed my reactions to EMF.

Wireless technology has affected my life: I had to leave my career because of my intolerances and sensitivities. For many like me, I was fine prior, but the condition is precipitated by an exposure to a chemical, virus, mold, or stress - which almost everyone is exposed to. And one in four people are more genetically predisposed for their bodies to "trip" into acute sensitivities. Almost everyone is sensitive on some level and just doesn't realize it.

For me, I was exposed to mold and learned that EMF makes the mold more active and toxic in the body. While removing myself from the moldy environment helped a little, fungus is near impossible to completely remove from the body, plus once the body is hyper-sensitized, it stays that way, so when I'm exposed to EMF, those fields actually mobilize the mycotoxins and all the symptoms return.

My daughter has the same issues due to prior exposures and genetics.

After years of failing trying to make other homes work, we had to use all our savings (and more) and actually build a special healthy home in the mountains to accommodate my daughter and my reactions. We have no Wi-Fi and use kill switches in the bedrooms. We did many other specific things to minimize issues. Currently we're dealing with Smart Meter issues that utilities make us use, and that neighbors use.

School Wi-Fi has become a problem for my daughter. Going anywhere for an extended about of time is an issue because of Wi-Fi. Why our country doesn't follow the Precautionary Principle (or better yet, listen to all the non-political research already out there) is beyond me. We should use common sense. European countries (many) don't have Wi-Fi in schools because the research is clear.

While I understand and appreciate the benefits of technology, I'm concerned that there is no choice if one wants to avoid exposures - and more and more people are getting sick without knowing why. Yet the research is clear, as is the common sense experience. We don't need more studies to show that kids' behavior and health (and adults', too) is being directly affected by EMF and Wi-Fi.

Every day I meet or hear about someone else - adult or child - who is suddenly dealing with the same incredibly difficult reactions. It's a health issue that is growing rapidly and affecting more people. We are past the tipping point.
