I became quite ill the beginning of April, 2017. The symptoms appeared to be that of a flu, and I expected it to be over within a week to ten days. I had not had a cold or a flu in many years, but a month later still exhibiting the same symptoms that one associates with a flu, I decided I must have some wicked allergies as a flu would not be so persistent. Some allergy medicines did seem to reduce the level of head ache, head and throat congestion, drippy nose and constant mucous discharge. Sore joints persisted. My hair turned grey and fell out. My brain was continually foggy and disoriented with profound memory loss, and nothing seemed to help that to dissipate. I became very lethargic and spent more time in front of the computer unable to move, eventually not caring much about anything as I thoroughly expected death to arrive soon.

By mid-August I was alerted online to Arthur Firstenberg's book signing on "The History of Electricity". During the presentation I came to realize that I was exhibiting all the symptoms of electrical poisoning. I was astounded as I couldn't understand why as I lived away from the city, had only a wired computer set up and rarely ever used a cell phone. As I was getting my book signed a friend was talking to me and I explained my circumstance. He suggested that he check my computer set up as I finally recalled that yes, my modem had been replaced in 2016. Later checking the date it was December 3, 2016, precisely four months before the onset of the illness. A few days later he discovered that Wi-Fi had been activated during the new modem set up. Two days after he deactivated the Wi-Fi___33 I started feeling a noticeable improvement.

Many days now I can be fairly well although not fully recovered; however, anytime I am in a situation where Wi-Fi is around, I backslide and wake up congested and coughing the next morning feeling depressed and unwell. I use a gauss meter to test my home environment. I stay as far as I can from electrical burners while cooking food, away from the running refrigerator, away from people using cell phones, away from some automobiles. I know where the hot spots exist in places that I need to go and of course avoid those as much as possible. Very recently I bought some clothes to protect me from EMF as i am hoping to fly across country to see my about to be born first grandchild. I am trying to buy everything I need before 5G is implemented on every block in my nearby town as I will no longer be able to go there with impunity. I hear some grocery stores will be doing home delivery. I consider quitting my well-loved job as by being there I am often exposed to Wi-Fi and suffer. With 5G coming I may not be able to withstand the exposure; I am sure my life span has been shortened due to EMF. The aging process accelerated during exposure.

I realize many people must be suffering not knowing why. I am lucky that I found what the problem was. I am very grateful to those who helped with the discovery and alleviation. I have heard the US is to be blanketed with 5G resorting to satellites to do so, if necessary. I can assure you that many people will die from this. Hopefully people will understand this is a valid health issue and will do their best to avert danger to themselves, their families and neighbors. Please do not be fooled by the rhetoric of those hoping to make money and reduce population in the process. The beauty of the human spirit will persist. We as a nation will make the right choice to promote the health and welfare of those we love!
