I am a professional woman and a very youthful 65 years. I am electrosensitive and this condition determines where and how I live. Every day I have to “work” at staying healthy and protect myself from Wi-Fi, EMF/RF, smart phones, cell phones and dirty electricity.

I spend hundreds and sometimes thousands of dollars a year trying to keep ahead of electronic pollution. I purchase protective products for my body, home and my one router-connected computer. I only use a land line telephone, and instantly feel a “piercing” when next to a working smartphone.

I have moved twice from cities where electronic pollution became more concentrated.
Of course, this has diminished my social and profession opportunities.

My noticeable symptoms began eight years ago with severe fatigue, aggressive reactions to normal stimuli (stubbing a toe, for example) and ear ringing. I could not use a computer Wi-Fi mouse without shooting pain, and could not spend much time at a computer without becoming annoyed and anxious.

Sleep was fitful and like many people, I'd be wide awake at odd hours with no medical reason. I could barely find the energy and motivation to leave my home, the effort seemed overwhelming. My world became increasingly small. I was not depressed or ill, but stymied to the changes in this once active, Type A, high-achieving career woman.

Without wearing a skalar pendant, a trip to a "big box" store results in blurry vision and irritability such that 10 minutes is the most time I can visit. Fatigue is a constant factor, despite my Herculean efforts to eat totally organic and healthy. I choose supplements and health products of the highest quality.

If a true 5G microwave system was installed near my home, I would once again move in a pre-emptive bid to secure a healthy and happy end-of-life. My basic health and happiness are being challenged, and more and more people are concerned and angry.

No one wants to deny an industry or corporation their livelihood or profits. I am not at all against progress and technology. The future is an exciting frontier for us all. However, I am sure that scientists and researchers can provide the high-tech advances without the damage to human tissue and functioning.

My mother, father and brother all died of cancer. I refuse to expose myself to obvious sources of cancer-inducing radiation on any level. I deserve the chance to live a long and healthy, happy life. I will work hard to halt the increasing and damaging exposures to unsafe electronic frequency delivery methods.

Thank you.
