03.03.18

My daughter and I both have electrohypersensitivity. We both have suffered from headaches for a couple of years but that all recently changed to severe headaches.

About 6 months ago I signed up for a bundled package and took advantage of the buy one get one smart phones. After about a week or so using my phone, I was could feel pain in my head and my head was heating up. I slept with the phone on in my bedroom and woke up with my head burning hot and red. Twice this happened and so I put the phone away from my bed. I kept getting the pain in my head and worse headaches so I quit using the phone altogether. I then noticed I would get the same pain every time someone with a cell phone would come near me. I finally convinced my family to turn off the phones. I did purchase an EMF/ RF radiation meter to track the emfs I was exposed to. I found the wifi box to be extremely high so I turned it off and used ethernet cord for my computer. My head was still hurting so badly it felt as if an iron rod was piercing my brain and my head was in a vice grip. I realized it was coming from my cordless phones. I replaced those with corded phones. If anyone even forgot to turn off their cell phone I would know immediately. I could feel the pain in my head.

My daughter had signed up for wifi about the same time as I did. She started having similar symptoms around the same time. We can no longer go out into public without having severe consequences. After my daughter went out to eat and shopping for a few hours she would become seriously ill with her head hurting so bad she would see black when standing up and would almost pass out. The pain was so debilitating it would cause vomiting. I experienced the same. The headaches could last for days at a time rendering me useless.

I also experienced skin burning and itching, extremely loud ringing in my ears, dizziness, digestive problems, brain fog, shooting pains in my head, and generally ill feeling. Fortunately, we live in the country and the emf levels on our property are next to 0 for now. By removing all the electronics and wireless devices from our home we were able to get our home emfs down to close to 0. I have slowly been recovering and so has my daughter, but only if we keep ourselves hostage in our home. The symptoms all come back when we go out to shop or do anything in the neighboring town or if we go out in public anywhere. There's not much we can do but stay home to keep ourselves from being ill.

We are very concerned what 5g will do to us. Not sure how we will survive if we have no safe place to live. Our lives have changed dramatically. We no longer have freedom. Not sure what our future holds. We can no longer travel and enjoy the world as normal people. This has been devastating to our whole family. Everywhere you go there is wifi and cell phones. If 5g comes to my rural community I'm not sure we will survive it.

Please help by doing the appropriate research on the radiation people are being exposed to. There are plenty of studies that have already been done. The technology is great but needs to be used responsibly and local governing bodies need to be involved to help protect their citizens.

Thank You,
