October 19, 2026

The Honorable Robert F. Kennedy Jr.
Secretary of Health and Human Services
Washington, D.C.

RE: My Personal Health Journey and the Improvements I've Experienced After Reducing Dirty Electricity in My Home

Dear Secretary Kennedy,

My name is Chad LaFleur, and I am writing to share a personal health experience that I believe deserves attention and further scientific investigation.

I have faced significant health challenges, including a diagnosis of pancreatic neuroendocrine cancer in 2014, which required surgery to remove tumors from my pancreas. Along with my cancer diagnosis, I have struggled with dangerously high blood pressure, frequent headaches, poor sleep, difficulty concentrating, chronic fatigue, and other ongoing health concerns.

At one point, my blood pressure reached 215/124, an extremely concerning level, despite my efforts to manage my health.

During my search for ways to improve my living environment, I learned about dirty electricity in 2016, or high-frequency electrical noise that can travel through household wiring.

I began testing my home in June of 2016, using the STETZERiZER Microsurge Meter and subsequently installed STETZERiZER filters throughout my entire home, using the meter to monitor and reduce electrical noise.

Within a few short month since completing the installation, I have experienced several noticeable improvements:

- Blood Pressure: My readings have improved from 215/124 to approximately 135/96.
- Sleep: I am sleeping better and feeling more rested.
- Headaches: I have noticed a reduction in headaches.
- Concentration: My mental clarity and ability to focus have improved.
- Overall Well-Being: I have noticed positive changes in my daily quality of life.

These improvements have been particularly meaningful while living with cancer and managing multiple health conditions.

I understand that my personal experience does not scientifically establish that the filters caused these improvements. However, the changes I have experienced since reducing the electrical noise measured in my home have been significant enough that I believe this subject deserves serious attention.

My request is simple: I encourage you and the Department of Health and Human Services to consider supporting independent research into dirty electricity and its potential relationship to blood pressure, sleep, headaches, concentration, and overall human health.

With the increasing number of electronic devices in our homes, I believe it is important to better understand the electrical environments in which Americans spend much of their lives.

I am not suggesting that STETZERiZER filters cure disease or replace medical treatment. I am simply sharing my personal experience in the hope that it may encourage further investigation into a subject that receives relatively little public attention.

Thank you for your time, your commitment to improving public health, and your willingness to examine environmental factors that may affect our well-being.

I would welcome the opportunity to share additional information about my experience and the electrical measurements taken in my home.

Sincerely,

Chad R. LaFleur
Wisconsin
